

Portfolio View — Metrics Reference

Portfolio View — Metrics Reference

A precise definition of every metric, filter, and column on the PMO **Portfolio View** page (apps/pmo/artifacts/project-hub/src/pages/portfolio.tsx). Last updated 2026-06-03.

Key principle: nothing on this page is split or bucketed by a percentage threshold. Grouping is by **categorical status**; “health” (RAG) is a **human-set** judgment; percentages (Progress) are **displayed only** and never decide a project’s group or health.

1. Data scope & filter pipeline

All numbers are computed over the **currently filtered set** of projects, in this order:

```
all projects
  → filters.Department (project.function == selected)
  → filters.Category    (project.category == selected: CAPEX | NPX |
CIP | IT)
  → filters.Stage       (project.status  == mapped value, see §5)
  → filters.Priority    (project.priority == selected: P0–P3)
= filteredProjects    ← KPI boxes, Project Health pie, Budget chart
use THIS
  → (optional) Project Health pie click → filter by ragStatus
= tableProjects    ← the Projects table/Timeline use THIS
```

So the **KPI boxes and pie always reflect the filter bar** (Department/Category/Stage/Priority). Clicking a pie slice filters **only the table**, not the KPIs/pie (so the pie never collapses to one slice).

2. KPI boxes (the 5 tiles)

Counts over filteredProjects. Note the boxes mix **two different dimensions** — health (RAG) for the first two, lifecycle status for the last two:

Box	Source field	Definition	Color
Total Projects	—	filteredProjects.length (count	neutral

Box	Source field	Definition	Color
On Track	rag_status	count where rag_status = "green" (a project with no RAG set counts as green)	 green
At Risk	rag_status	count where rag_status = "amber" or "red"	 amber
On Hold	status	count where status = "on_hold"	 red
Closed	status	count where status = "closed"	 blue

Caveat: On Track / At Risk are **RAG-based** (health), while On Hold / Closed are **status-based** (lifecycle). They are not mutually exclusive — e.g. an active project that is red counts in **At Risk** but not in On Hold/Closed.

3. Project Health (RAG distribution pie)

- **What it shows:** the breakdown of filteredProjects by **RAG health** — rag_status of green / amber / red.
- **Source:** the project's rag_status field — **set manually by the PM/PMO** (it is *not* derived from progress, budget, or schedule).
- **Null handling:** projects with no rag_status are treated as **green** in the On-Track count, but the pie only plots the three explicit colors.
- **Interaction:** click a slice (or its legend chip) → the **Projects table filters to that health color**; click again / "clear" to reset.

4. Budget Utilization (bar chart)

- **Per project budget** = capex_budget + opex_budget.
- The chart shows the **top 8** projects of the filtered set by name.
- The **Total Budget** figure (where shown) is the **sum** of capex_budget + opex_budget across filteredProjects.
- Currency formatted via the shared formatCurrency (₹, Indian grouping).

5. Filter bar

Filter	Field used	Options	Notes
Department	project.function (from the master employee directory function)	distinct values present in the data	
Category	project.category	CAPEX · NPX · CIP · IT	New investment-category field; null until assigned per project
Stage	project.status (label-mapped)	Plan →planning, Execute →active, Hold →on_hold, Close →closed	Labeled “Stage” but filters the status field; completed is not one of these 4 options
Priority	project.priority	Critical =P0, High =P1, Medium =P2, Low =P3	Stored values stay P0-P3; only labels are Critical/High/Medium/Low

6. Projects table

Grouping (the section headers)

- **Grouped by:** the project’s **status** field — **purely categorical, no percentage.**
- **Groups & order:** Active → Planning → On Hold → Completed → Closed (STATUS_GROUP_META).
- A group **only appears if it has ≥ 1 project.** Any unrecognized status falls into a grey catch-all group at the end.
- Current data → only **Active (31), Planning (3), Completed (1)** render; On Hold / Closed are empty so they’re hidden.

Columns

Column	Source	Definition
Project Name	name (+ function)	Always shown (anchor column); shows the department beneath
Timeline	start_date → end_date	A bar on a shared min..max date scale

Column	Source	Definition
		across the visible rows (mini-Gantt); colored by RAG; “—” if start or end missing
Status	status	Lifecycle status chip
Health	rag_status	RAG dot (green/amber/red)
Priority	priority	Critical/High/Medium/Low chip
Category	category	CAPEX/NPX/CIP/IT (— if unset)
Budget	capex_budget + opex_budget	Combined allocation
Progress	progress (rolled up)	Computed % = Subtask→Task→Milestone→Project average. Displayed only — does NOT determine the group or RAG.
Due	end_date	Project end date
• Column chooser (“Columns” button) toggles any column on/off (Project Name always stays). • Row click → opens the project detail page.		

7. What is (and isn't) percentage-driven

Surface	Driven by	% threshold?
Table grouping (Active/Planning/Completed...)	status	No — categorical
KPI On Track / At Risk	rag_status (human-set)	No
KPI On Hold / Closed	status	No
Project Health pie	rag_status (human-set)	No
Progress column	rolled-up progress_pct	It <i>is</i> a %, but it only displays — it never reclassifies a project

If you want a **percentage rule** introduced — e.g. auto-mark a project **At Risk** when progress lags its elapsed schedule, or auto-move to **Completed** at 100% — that’s a deliberate rule we can add. It does **not** exist today.

8. Rollup chain (where Progress comes from)

progress_pct is computed bottom-up on every task/milestone write (lib/rollup.ts):

Subtask % → Task % (avg of children)
Task % → Milestone % (avg of top-level tasks)
Milestone % → Project % (avg of contributing milestones)
Project % → Portfolio (avg on read, exec view)

RAG and gate decisions are **excluded** from this rollup on purpose — they remain human-controlled governance signals.
